

# Home Page

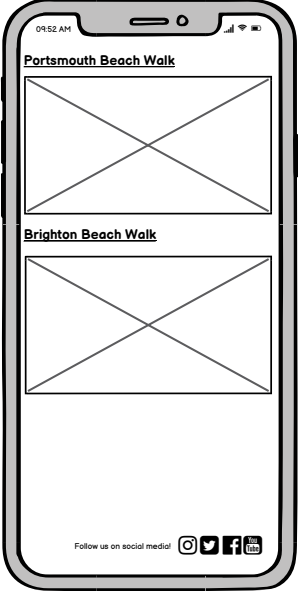

The menu icon will be the nav bar and float to the right of the screen.

It will contain the same links as seen on the full desktop nav bar but compressed down to the mobile friendly nav icon.

I am currently undecided on the nav bar and page header to either have them static at the top of the webpage or to have the float and follow the user when scrolling down the site.

I will review this when I have coded the website and am going through testing the website.

I will decide on the best option to give to best user friendly navigation around the website.
